Planora Design Handoff

Design tokens, component states and rationale | 24 September 2026

Planora is a shared travel planning workspace for internal agents and partner agencies. This handoff records the visual system visible in the submitted frames and specifies reusable domain components for the remaining service workflows. Dimensions and additional component states below are implementation recommendations unless explicitly described as shown in the current screens.

Submission coverage

Shown in supplied screens	Specified here for completion
Splash start and ready; login; wrong credentials; unactivated account; first time password setup; internal agent dashboard	Partner agency dashboard, enquiries list, trip detail, flights, hotels and restaurants; standalone component and state boards

The wrong credentials and unactivated account screenshots currently show red input borders. In implementation, reserve red field borders for a field-level error. Use a form-level alert for invalid credentials and an amber information alert for an unactivated account.

Colour tokens

Token	Value	Use
Ocean 900	#102F3A	Sidebar, high-contrast surfaces, primary text on pale surfaces
Ocean teal 600	#086B75	Primary actions, active navigation, focused controls
Sea glass 300	#78C9C6	Progress line, restrained accent
Warm surface	#F8F7F3	Application canvas
White	#FFFFFF	Cards, forms and modal surfaces
Slate 800	#203139	Main content text
Border 200	#DBE5E5	Field and panel outlines, row separators
Apricot 400	#D9AC7C	Travel accent; do not use for body text
Error surface / text	#FFF0EF / #A63131	Incorrect credentials, overdue and destructive feedback
Warning surface / text	#FFF4E6 / #895100	Account not activated; aging work
Success surface / text	#DDF5EF / #126652	Supplier confirmed or successful save
Info surface / text	#E8F4F8 / #15556C	Requested, loading follow-up context
Neutral surface / text	#EEF1F3 / #435461	Draft and cancelled when subdued

Type spacing radius and elevation

Category	Specification	Application
Heading font	Manrope 700 / 32, 28, 22 px	Page, section and card headings
Interface font	Inter 600 / 16, 14 px; Inter 400 / 14, 12 px	Actions, field labels, rows and metadata
Small label	Inter 600 / 11 px, tracking 0.08em	Role eyebrow and uppercase service category
Line height	Headings 1.2; UI copy 1.45	Wrap long service names without clipping
Spacing scale	4, 8, 12, 16, 24, 32, 40 px	8 px base, with 4 px for dense tables
Radius	Fields/buttons 8 px; cards/modals 12 px; chips 6 px	No oversized rounded dashboard cards
Elevation	E0 none; E1 0 1px 4px rgba(16,47,58,.08); E2 0 8px 24px rgba(16,47,58,.14)	E1 cards; E2 modal and floating menu
Minimum targets	40 px desktop controls; 44 px touch targets	Keyboard focus ring: 2 px teal with 2 px offset

Domain status vocabulary

Use both a readable label and a consistent colour. Trip and enquiry states are separate from individual service states; a partially booked trip can contain a confirmed flight and a requested hotel.

Service state	Chip treatment	Meaning and next action
Draft	Neutral gray; pencil icon	Incomplete service; edit details
Quoted	Soft blue; document icon	Price presented; review or accept
Requested	Amber; clock icon	Supplier contacted; follow up after due time
Confirmed	Soft green; check icon	Supplier has confirmed; view reference
Cancelled	Gray outline; crossed-circle icon	No longer progressing; preserve history

Additional queue labels: New (blue), Awaiting client decision (apricot), Overdue (coral), and Lost (gray). Never rely on colour alone; show elapsed time and the person who must act.

Core components and real states

Component	Default and required edge examples	Behaviour
Buttons	Primary Sign In / New Enquiry; secondary Back; text Resend activation email; disabled Saving...	Preserve label width during loading; one primary action per form or panel.
Inputs	Empty, populated, keyboard focus, invalid email, mismatched password	Visible label above field; error below field; focus moves to first invalid field.
Table row	Normal enquiry and long name: “Private coastal sunset dining reservation with vegetarian tasting menu”	Allow two lines for service name; keep status, owner, amount and row action aligned; no silent truncation of identifying details.
Tabs	Dashboard queue tabs; selected, hover, focus, zero count	Selected state has visible border or fill as well as text; counts update with filters.
Status indicators	Draft, Quoted, Requested, Confirmed, Cancelled, Overdue	Text plus icon and colour; show service state separately from trip state.
Modal	Confirm cancellation; default, submitting, failure	State service name and consequence; focus trap; Cancel and Confirm cancellation.
Toast	Success “Booking request sent”; error “Could not save changes”	Announce to assistive tech; success may dismiss; error offers Retry.
Empty list	“No enquiries match these filters.” Clear filters	Preserve search term and filter context; avoid a blank panel.
Loading panel	3–4 skeleton rows matching final content density	Do not replace entire app with spinner; retain headings and navigation.

Screen-specific application

Agent dashboard: priority counts open filtered worklists. The image banner stays shallow; row data is text-led. The “Supplier confirmation” queue contains requested flights, hotels and restaurants that the supplier has not confirmed.

Partner agency dashboard: show only its own enquiries, quotations awaiting accept or decline, and booking updates. Replace internal follow-up actions with Add details, Review quotation and View booking.

Enquiries list: fixed header, search by client, destination or reference, status and owner filters, sortable date columns, and a clear no-results state. Trip detail: one mixed service list with type-specific summary, service status and price, trip total, and inline Add service. Flights compare time, stops, layovers and fare rules; hotels compare property then room and quantity × nights; restaurants compare exact and nearby time slots and identify telephone-only booking.

Written rationale

I chose **Planora** because the name brings together planning and direction in a way that suits a professional travel workspace. The tagline, “**Every journey, connected,**” reflects the product’s purpose: keeping enquiries, quotations and supplier bookings together as one trip.

The visual direction changes as the user moves into the product. The splash and login screens use travel photography to establish the brand. On the internal agent dashboard, the image becomes a shallow header so the work needing attention remains visible. Three queues answer the agent’s morning questions: which enquiries need a reply, which quotations need a decision, and which booking requests still need supplier confirmation. Each item shows its context, waiting time, status and next action. Compact rows help an experienced agent scan several tasks without excessive scrolling.

I used Planora’s ocean colours throughout, with coral, apricot and sea-glass accents to distinguish urgency and work type. Statuses also have written labels, so meaning does not depend on colour alone. The proposed service screens would share navigation, controls and selection patterns, while allowing flights, hotels and restaurants to present the information relevant to each decision.

I ruled out large destination cards within work queues and decorative dashboard charts because they would take space away from live tasks. I would use photographs where they help a decision, particularly when comparing hotels, and give flight schedules and fare rules more room for text.

Within the available time, I completed the splash, login and its variants, first-time password setup, and internal agent dashboard. I could not complete the partner agency dashboard, enquiries list, trip detail or the three service search screens. With more time, I would design those pages using representative travel and pricing data, draw the required component states, and test the busiest workflows with agents—especially a trip containing fourteen services.

Proposed Design for the Unfinished Pages

The following is a **design proposal**, not a description of completed Figma screens. All five pages would keep Planora’s sidebar, search placement, ocean-teal actions, type scale and status indicators. Their results would use different layouts because agents make different decisions for flights, hotels and restaurants.

04 — Enquiries List

I would design this as a **dense, searchable table** for an agent managing around 200 enquiries. A compact page heading and **New enquiry** button would sit above a search field for client name, destination or enquiry reference. Beside it, filters would cover status, owner and travel date; active filters would appear as removable chips.

Every row would show **client, destination, travel dates, travellers, value, owner and status**. Status chips would distinguish **New, Quoted, Accepted, Partially booked, Fully booked and Lost**. Agents could sort by recent activity or travel date, and open an enquiry by selecting its row. The table header would remain visible while scrolling.

A second frame would demonstrate a search with no matches. It would retain the search term and filters, then show “**No enquiries match these filters**” with a **Clear filters** action.

05 — Trip Detail

This would be the agent’s main working page. A compact header would identify the **client, destination, dates, travellers, owner and enquiry status**. Below it, one chronological service list would mix flights, hotels and restaurants. Each service would use the same outer row structure—**type icon, name, key details, status, price and action**—but its summary would fit the service: flight route and times; hotel, room and nights; or restaurant, table time and covers.

A persistent trip summary would show the **total price** and make it clear which services are only quoted or requested. **Add service** would open an in-page panel offering Flight, Hotel or Restaurant, so the agent keeps the trip in context. I would show both an **empty trip** with a useful first action and a **fourteen-service trip** with compact rows and clear section navigation.

06 — Flights Search and Select

This page would favour **side-by-side comparison over photography**. A compact search bar would retain route, dates and passenger count above the results. Each result would show airline, departure and arrival times, duration, stop count and the airport at every connection. Expanding an itinerary would reveal its legs in order, with a conspicuous label for a **tight** or **overnight** layover.

Under each itinerary, aligned fare options—**Economy, Premium and Business**—would compare price, baggage and cancellation terms before the agent selects one. A separate no-results frame would show the searched route and dates with an action to **Edit search**. This flow would end when a fare is selected.

07 — Hotels Search and Select

Hotels would use a **two-step decision within one result**: choose a property, then choose a room. Each property card would show a photograph, name, star rating, location, guest score and lead price. An expanded card would list specific room types with their rate, board basis and cancellation terms.

The search context would state **3 rooms · 5 nights**. Each room rate would show its unit price and calculated total for that quantity and stay, so the agent knows what they are selecting. One result would deliberately use a clean **“Photo unavailable”** placeholder while retaining all other property details. The action would say **Select room**, rather than Select hotel.

08 — Restaurants Search and Select

The search bar would keep **date, requested time and number of covers** visible. Compact venue results would show cuisine, location, price band and whether booking through Planora is available. Availability would be the main decision area.

For a venue where the requested time is unavailable, I would show **“7:00 PM unavailable”** alongside selectable nearby slots such as **6:30 PM** and **7:30 PM**. For a telephone-only venue, the card would say **“Arrange by phone”**, show the number and provide an action to record the outcome. It would look like a supported manual workflow, not a failed online booking.

Across all three service searches, I would reuse the same search header, filter pattern, result border, status chip, price alignment and selection behaviour. The information inside each result would change to match the decision the agent needs to make.
